

Phase 1 Criteria derivation

Gioia coding of literature and expert input
⇒ eight criteria (C1 to C8)

Phase 2 Criterion weighting

Best-Worst Method (linear model)
⇒ criterion weight vector

Phase 3 Alternative ranking

TOPSIS over six candidate NSMs
⇒ closeness coefficient and universal rank

Segmentation

Re-run per archetype BM1 / BM2 / BM3
⇒ context-specific rankings

Validation and robustness

Expert-panel BWM weights
(n = 30, rho = 0.762)

Survey-derived decision matrix (same endpoints)

Dual-weight TOPSIS

Sensitivity sweep
(±10% / ±20%)
